# **Topology and Knot Theory**

Fall 2023 - R. L. Herman

#### From Wikipedia

"In mathematics, topology (from the Greek *t*opos, 'place', and *l*ogos, 'study') is concerned with the properties of a geometric object that are preserved under continuous deformations, such as stretching, twisting, crumpling and bending, but not tearing or gluing."

History of Math

## Nobel Prize in Physics 2016

Topologogy is a field of mathematics that describes properties that are stable and only change in integer steps: 1, 2, 3 ....

The number of holes is a opological invariant that is always an integer, but never anything in between.

#### Figure 1: Nobel Prize in Physics 2016

History of Math R. L. Herman Fall 2023 2/36

# Geometry vs Topology

History of Math R. L. Herman Fall 2023 3/36

**General topology (Point Set Topology)** Study of basic topological properties derived from properties such as connectivity, compactness, and continuity.

Metric topology Study of distance in different spaces.

Algebraic topology (Combinatorial Topology) Study of topologies using abstract algebra like constructing complex spaces from simpler ones and the search for algebraic invariants to classify topological spaces.

Geometric topology Study of manifolds and their embeddings.

**Network topology** Study of topology discrete math. Network topologies are graphs consisting of nodes and edges.

**Differential Topology** Study of manifolds with smoothness at each point to allow calculus.

# **Origins of Topology**

# The search for a type of geometry where distance is not relevant.

# Leonhard Euler (1707-1783) - Königsberg Bridges

- 1736 Correspondences with Carl Gottlieb Ehler (1685-1753)
- Ehler's Letter

"You would render to me and our friend Kuhn a most valuable service, putting us greatly in your debt, most learned sir, if you would send us the solution, which you know well, to the problem of the **seven Königsberg bridges** together with a proof. It would prove to an outstanding example of the calculus of position [calculi situs] worthy of your great genius. I have added a sketch of the said bridges."

# Leonhard Euler (1707-1783) - Königsberg Bridges

- 1736 Correspondences with Carl Gottlieb Ehler (1685-1753)
- Euler's reply

"Thus you see, most noble sir, how this type of solution bears little relationship to mathematics and I do not understand why you expect a mathematician to produce it rather than anyone else, for the solution is based on reason alone, and its discovery does not depend on any mathematical principle. Because of this, I do not know why even questions which bear so little relationship to mathematics are solved more quickly by mathematicians than by others. In the meantime most noble sir, you have a assigned this question to the geometry of position but I am ignorant as to what this new discipline involves, and as to which types of problem Leibniz and Wolff expected to see expressed this way."

- Based on Liebniz's geometria situs and analysis situs.
- Geometry of position: concerned only with the determination of position and does not involve using distances.

• Euler's result did not depend on the lengths of the bridges or on their distance from one another, but only on connectivity.

History of Math R. L. Herman Fall 2023 7/36

• A connected graph has an Euler cycle

 $\Leftrightarrow$  every vertex has even degree.

History of Math

R. L. Herman Fall 2023 7/36

- 1750, Euler wrote Christian Goldbach (1690-1764)
- For polyhedron, like Platonic solids,

V - E + F = 2.

- Published papers in 1752.
- Not known before.
  - Descartes was close (1676).
- Euler characteristic:  $\chi = V E + F$ .

Shape	Vertices	Edges	Faces
Tetrahedron	4	6	4
Cube/Hexahedron	8	12	6
Octahedron	6	12	8
Dodecahedron	20	30	12

#### PROPOSITIO IV.

 S3. In omni folido bedris planis inclufo aggregatum ex numero angulorum folidorum et ex numero bedrarum. binario excedit numerum acierum.

#### DEMONSTRATIO.

Scilicet fi povatur vt hactenus : numerus angulorum folidorum = S numerus acierum - - - = A numerus hedrarum - - = H demonfirandum eft, effe S + H = A + 2.

# There Are Exactly Five Regular Polyhedra

## **Proof:**

- Let n = # of sides of each face.
- Let m = # of faces meeting each vertex.

• 
$$E = \frac{1}{2}Fn$$
 and  $V = \frac{1}{m}Fn$ .

• Since V - E + F = 2,

$$F=\frac{4m}{2n-mn+2m.}$$

• 2n - mn + 2m > 0 and  $n \ge 3$ . n = 3 : 2n - mn + 2m = 6 - m. So, m = 3, 4, 5. n = 4 : 2n - mn + 2m = 8 - 2m. So, m = 3. n = 5 : 2n - mn + 2m = 10 - 3m, m = 3.

Solutions (*n*, *m*) (3, 3) tetrahedron, (3, 4) octahedron, (3, 5) icosahedron, (4, 3) cube, (5, 3) docecahedron.

## Euler Characteristic of a Sphere

- Inscribe Platonic solids in a sphere.
- a to b: Add 2 vertices, 4 faces, 6 edges.  $\Delta \chi = 2 6 + 4 = 0$
- Push faces to sphere surface.
- Euler characteristic,  $\chi = V E + F = 2$ .

# Kepler's Polyhedra - 1619 Harmonice Mundi

- Johannes Kepler (1571-1630) systematized and extended polyhedra.
- He defined classes of polyhedra and proved that his set was complete.
- Kepler-Poinsot polyhedron regular star polyhedra.
- Stellated polyhedra extend edges or faces until they meet to form a new polyhedron.

## **Scottish Physics and Knots**

James Clerk Maxwell (1831-1879), Peter Guthrie Tait (1831-1901), and William Thomson (1824-1907)

https://www.gutenberg.org/files/39373/39373-h/39373-h.htm

Maxwell and Tait met at Edinburgh Academy, went to University 1847. Thomson (22) elected to Glasgow College Chair of Natural Philosophy.

History of Math R. L. Herman Fall 2023 20/36

#### James Clerk Maxwell and Helmholtz's Water Vortices

Maxwell read Gauss' work and referred to the work of Liebniz, Euler, and Vandermonde on *geometria situs*.

Maxwell wrote to Tait about Helmhotz's paper.

Tait's interest in Helmholtz was from recalling reading Hamilton's *Lectures* in 1853 and remembering formulae.

Über Integrale der hydrodynamischen Gleichungen, welche den Wirbelbewegungen entsprechen.

Es sind bisher Integrale der hydrodynamischen Gleichungen fast nur unter der Voraussetzung gesucht worden, dafs die rechtwinkligen Componenten der Geschwindigkeit jedes Wassertheilchens gleich gesetzt werden können den nach den entsprechenden Richtungen genommenen Differentialquotienten einer bestimmten Function, welche wir das Gescheindigkeitspotential nennen wollen. Allerdings hat schon Lagrange\*) nachgewiesen, dafs diese Voraussetzung zuläsig ist, so oft die Bewegung der Wassermasse unter, dem Einflusse von Kräften entstanden ist und fortgesetzt wird, welche selbst als Differentialquotienten eines Kröftepotentials dargestellt werden können, und dafs auch der Einfluß hewezeter fester Könren, welche mit der Plässikeit in Glenlair Dalbeattie, Nov. 13, 1867.

Dear Tait

If you have any spare copies of your translation of Helmholtz on "Water Twists" I should be obliged if you could send me one.

I set [sic] the Helmholtz dogma to the Senate House in '66, and got it very nearly done by some men, completely as to the calculation, nearly as to the interpretation.

Thomson has set himself to spin the chains of destiny out of a hind plenum s M. Soott set an eminent person to spin ropes from the sea sand, and I saw you had put your calculus in it too. May you both prosper and disentangle your formulae in proportion as you entangle your worbles. But I fear the simplest indivisible whirl is either two embracing worbles or a worble embracing itself.

For a simple closed worble may be easily split and the parts separated

but two embracing worbles preserve each others solidarity thus

though each may split into many, every one of the one set must embrace every one of the other. So does a knotted one.

yours truly J. CLERK MAXWELL R. L. Herman Fall 2023 21/36

# Sir William Rowan Hamilton (1805–1865)

This led Tait to work on quaternions.

Hamilton discovered **quaternions** in 1843, an extension of complex numbers: w + xi + yj + zk, where w, x, y, z are real and i, j, k satisfy the bridge equations.

Figure 5: Hamilton carved his equations into the stone of the Brougham Bridge while on a walk.

#### Back to vortex rings ...

#### From Vortex Rings to Vortex Atoms

https://i.imgur.com/Y64h8ol.mp4 Movie

Tait experimented with smoke rings in 1867.

Thomson wrote to Helmholtz ... later wrote *On vortex atoms* as vortex rings in the aether.

# Tait - Classification of Knots

- Knots up to 7 crossings reduced to 8 different knots.
- Periodic table of knot elements [Mendeleev 1869].
- Tables up to 10 alternating crossings.
- Aether disproved in 1887 by Michelson Morley Experiment.

Put ideas in envelope for the Royal Society of Edinburgh [Open by 15/10/1987].

History of Math R. L. Herman Fall 2023 24/36

# Tait Conjectures<sup>1</sup>

- 1. Reduced alternating diagrams have minimal link crossing number.
- 2. Any two reduced alternating diagrams of a given knot have equal writhe.
- 3. The flyping conjecture, which states that the number of crossings is the same for any reduced diagram of an alternating knot.

In 1987 one of Tait's conjectures was found in the envelope.

1,2 proved by Kauffman, Murasugi, and Thistlethwaite 1987.

3 proved by Menasco and Thistlethwaite, 1991 using Jones polynomials, 1984.

Perko Pair 1974
