

15.30. Consider the following relation:

CAR\_SALE(Car#, Date\_sold, Salesperson#, Commission%, Discount\_amt)  
 Assume that a car may be sold by multiple salespeople, and hence {Car#, Salesperson#} is the primary key. Additional dependencies are  
 Date\_sold → Discount\_amt and  
 Salesperson# → Commission%

Based on the given primary key, is this relation in 1NF, 2NF, or 3NF? Why or why not? How would you successively normalize it completely?

15.31. Consider the following relation for published books:

BOOK (Book\_title, Author\_name, Book\_type, List\_price, Author\_affil, Publisher)

Author\_affil refers to the affiliation of author. Suppose the following dependencies exist:

Book\_title → Publisher, Book\_type

Book\_type → List\_price

Author\_name → Author\_affil

a. What normal form is the relation in? Explain your answer.

b. Apply normalization until you cannot decompose the relations further. State the reasons behind each decomposition.

15.32. This exercise asks you to convert business statements into dependencies. Consider the relation DISK\_DRIVE (Serial\_number, Manufacturer, Model, Batch, Capacity, Retailer). Each tuple in the relation DISK\_DRIVE contains information about a disk drive with a unique Serial\_number, made by a manufacturer with a particular model number, released in a certain batch, which has a certain storage capacity and is sold by a certain retailer. For example, the tuple Disk\_drive ('1978619', WesternDigital, A2235X, 765234, 500, CompUSA) specifies that WesternDigital made a disk drive with serial number 1978619 and model number A2235X, released in batch 765234; it is 500GB and sold by CompUSA.

Write each of the following dependencies as an FD:

a. The manufacturer and serial number uniquely identifies the drive.

b. A model number is registered by a manufacturer and therefore can't be used by another manufacturer.

c. All disk drives in a particular batch are the same model.

d. All disk drives of a certain model of a particular manufacturer have exactly the same capacity.

15.33. Consider the following relation:

R (Doctor#, Patient#, Date, Diagnosis, Treat\_code, Charge)

15.34. Consider the following relation:

CAR\_SALE (Car\_id, Option\_type, Option\_listprice, Sale\_date, Option\_discountprice)

This relation refers to options installed in cars (e.g., cruise control) that were sold at a dealership, and the list and discounted prices of the options.

If CarID → Sale\_date and Option\_type → Option\_listprice and CarID, Option\_type → Option\_discountprice, argue using the generalized definition of the 3NF that this relation is not in 3NF. Then argue from your knowledge of 2NF, why it is not even in 2NF.

15.35. Consider the relation:

BOOK (Book\_Name, Author, Edition, Year)

with the data:

Book Name	Author	Edition	Year
DB_fundamentals	Navathe	4	2004
DB_fundamentals	Elmasri	4	2004
DB_fundamentals	Elmasri	5	2007
DB_fundamentals	Navathe	5	2007

a. Based on a common-sense understanding of the above data, what are the possible candidate keys of this relation?

b. Justify that this relation has the MVD { Book } → { Author } || { Edition, Year }.

c. What would be the decomposition of this relation based on the above MVD? Evaluate each resulting relation for the highest normal form it possesses.

15.36. Consider the following relation:

TRIP (Trip\_id, Start\_date, Cities\_visited, Cards\_used)

This relation refers to business trips made by company salespeople. Suppose the TRIP has a single Start\_date, but involves many Cities and salespeople may use multiple credit cards on the trip. Make up a mock-up population of the table.

a. Discuss what FDs and/or MVDs exist in this relation.

b. Show how you will go about normalizing it.
