Go to my webpage and statistics folder to find the SPSS dataset located under exam #3 materials. Use that dataset to conduct the following analyses. Hand in the output for each of the analyses. For each analysis, indicate what the results were by writing your findings in APA format.

1. Conduct a oneway ANOVA using condition as the independent variable and feelings toward the defendant as the dependent variable. Report your findings in APA format. Why have you conducted an Anova and not some other analysis?

2. Conduct an independent samples t-test on ages using gender as the independent variable. Do males differ significantly in age from females? Make sure you report the means and standard deviations for each group.

3. Compute a new variable (dehumanizing language-yes/no) and conduct an independent samples t-test using this variable as your independent variable and feelings toward the defendant as your dependent variable. What is the result of the test, does dehumanizing language matter to jurors? Have you violated the homogeneity of variance assumption? How did you determine this? Report your t-test in APA format and report the means and standard deviations.
